> "A recent study by Gartner Group discovered that of all companies experiencing a "major loss" of computer records:

43% Never opened again.
51% Closed within two years.
6% Survived over the long term.

Automatic Offsite Image Backup

Volume Level Backups

The SecureImage Backup Solution by Impact utilizes market leading image based backup and replication software. The Backup and Disaster Recovery Software creates local sector level backup of your servers at the 'volume' level to a local server storage device. These backups are 'point-in-time' representations of the entire volume and therefor include all data such as the OS, applications, services, configurations, along with all your data. This type of backup is desirable as it allows for quick and easy restores at multiple levels.

Features

- **Data / file restore:** Mount backup image for quick file restores

- **Brick Level Exchange Mail Restore:** Our Exchange Restore Utility allows for single\email message restore or full Exchange database restores without the hassle of using Exchange Recovery Groups.

- **Bare Metal Server Recovery:** Full server recovery to a specific point-in-time on dissimilar hardware or in a virtual environment. This allows for quick recovery in the event of a true disaster.

- **Offsite 'Point-In-Time' backups** include ten daily images, four weekly images and two monthly images stored in the cloud (no limit on data size). Local recovery is only limited by the size of the included NAS device used to store the backups.

- **Fast Recovery:** Recovery from offsite storage is done via an external hard drive that is shipped overnight air for quick recovery.

Impact's SecureImage provides an easy to use solution for full server backup and Disaster Recovery

SIMPLE

- Small software footprint
- Backup to small form factor NAS device for quick local restores

SAFE

- Secure Off-Site Storage
- Next day access to the entire cloud data set

SECURE

- 256 Bit Encryption
- Password protected data image files
